More Sleep for Parents of Diabetic Kids, PredictBGL App

Melbourne, Australia – PredictBGL, a smart phone app for insulin-dependant diabetics, now integrates live blood sugar data from Dexcom Continuous Glucose Monitors (CGM) to streamline dosing decisions and provide instant patient decision support.

The technology is useful for patients with Type 1 diabetes, and for parents of kids with Type 1 diabetes, who cope with significant stress avoiding dangerous low blood sugars, especially overnight.

“My husband and I used to take turns to wake at midnight, 2am, 4am and 6am”, says Michelle, Mum to Shaun. “We could never forgive ourselves if Shaun died in his sleep due to a low blood sugar we missed. With PredictBGL, we can now proactively see hours ahead what his blood sugars should be doing. It has changed our lives”.

Type 1 Diabetes is an auto-immune disease where the body cannot make insulin any more. Normally the body uses insulin to regulate blood sugars in a narrow band. In diabetes, blood sugars rise steadily until hospitalization. Injected insulin must then be carefully tailored to the patient, their food intake, activity, and many other factors to avoid blood sugars getting too high or too low, both of which lead to dangerous short and long-term complications.

PredictBGL is the first system to integrate live CGM data – other systems have three hour delays and do not integrate dose information.

PredictBGL also integrates nutrition data from 5 million foods via food apps, data from blood glucose meters, fitness devices, manual data, insulin pumps and Continuous Glucose Monitors (CGM) with the patient’s biometrics to generate doses and predictions in real-time.
